

**POWER LAWS**

It is important to be able to simplify or expand algebraic expressions involving powers. We begin with the following rules:

$$a^x a^y = a^{x+y} ; \quad \frac{a^x}{a^y} = a^{x-y} ; \quad (a^x)^y = a^{xy} . \quad (*)$$

It is worth spending a little time in *understanding* these rules: if you try to memorise them without understanding you will find this topic very difficult later on. To understand the first, consider for example

$$a^8 a^3 = (aaaaaaaa)(aaa) = aaaaaaaaaaaa = a^{11} = a^{8+3} .$$

The key step is the second: it should be easy to see that we can combine a group of eight *as* and a group of three into a group of eleven. Similarly, the last formula in (\*) is illustrated by

$$\begin{aligned} (a^2)^5 &= (a^2)(a^2)(a^2)(a^2)(a^2) \\ &= (aa)(aa)(aa)(aa)(aa) = aaaaaaaaaa = a^{10} = a^{2 \times 5} , \end{aligned}$$

where we have combined five groups of two *as* into a single group of ten.

Three more important rules are

$$a^0 = 1 ; \quad a^1 = a ; \quad a^{-y} = \frac{1}{a^y} .$$

To understand why the last of these is true, go back to the second formula in (\*) and substitute  $x = 0$ .

(Some of) the above formulae involve the same base to two different powers. There are also rules where we have an expression involving two bases to the same power:

$$a^x b^x = (ab)^x ; \quad \frac{a^x}{b^x} = \left(\frac{a}{b}\right)^x .$$

Once again you should try to understand why these are true. For the first, we know that we can multiply numbers in any order we like without affecting the result; so, for example,

$$(ab)^5 = (ab)(ab)(ab)(ab)(ab) = (aaaaa)(bbbb) = a^5 b^5 .$$

Note that expansions like  $(a + b)^x$  are not so easy (**not**  $a^x + b^x$  !!) and are usually treated by means of the Binomial Theorem.

Although we have so far been thinking of the exponents  $x, y$  as integers, the same rules apply for any real numbers. A fractional power means a root: for example

$$a^{1/2} = \sqrt{a} ; \quad a^{1/3} = \sqrt[3]{a} ; \quad a^{4/5} = (a^4)^{1/5} = \sqrt[5]{a^4} .$$

It is harder to say precisely what is meant by an expression like  $a^\pi$  (remember that  $\pi$  is not a fraction) – follow calculus lectures for this. Finally, remember that a power expression may be undefined for certain values of  $a$ . For example,  $a^{1/2}$  is meaningless if  $a$  is negative, and  $a^{-2}$  is meaningless if  $a = 0$ .

**Examples.**

- $\frac{a^2(ab)^3}{b^4} = \frac{a^2 a^3 b^3}{b^4} = a^5 b^{-1} = \frac{a^5}{b}$ .
- $(2c^2 d^5)^3 = 2^3 (c^2)^3 (d^5)^3 = 8c^6 d^{15}$ .
- $(x^4 y^5 z^6 y^7 z^8)^{1/4} = (x^4 y^{12} z^{14})^{1/4} = xy^3 z^{7/2} = xy^3 \sqrt{z^7}$ .
- $(x^{1 \cdot 2} y^{3 \cdot 4})^2 x^{-5 \cdot 6} = x^{2 \cdot 4} y^{6 \cdot 8} x^{-5 \cdot 6} = x^{-3 \cdot 2} y^{6 \cdot 8}$ .

## EXERCISES.

Please try to complete the following exercises. Remember that you **cannot** expect to understand mathematics without doing lots of practice! Please do not look at the answers before trying the questions. If you get a question wrong you should go through your working carefully, find the mistake and fix it. If there is a mistake which you cannot find, or a question which you cannot even start, please consult your tutor or the Mathematics Drop-in Centre.

- Following the examples in the first paragraph, write powers in terms of multiplication in order to “explain” the identity  $a^9/a^4 = a^{9-4}$ .
- Write the following expressions in terms of products of powers, where each pronumeral occurs once only:
  - $\frac{x^9(xy^5)^{-2}}{(x^4y)^3}$ ;
  - $(a^{2/3}b^{4/5})^6$ ;
  - $\frac{(x^5y^3)^{1.3}}{(x^{2.4}y^{3.1})^2}$ ;
  - $\frac{(abc^2)^3}{(b^2c)^5} \div \frac{(a^3b)^6}{(a^4bc^2)^2}$ .
- Write the following radical expressions in terms of powers, and then simplify them:
  - $\sqrt{a^3y^7} \sqrt[3]{a^8y^{-10}}$ ;
  - $\frac{\sqrt[4]{x^5y^6}}{(\sqrt{x} \sqrt[3]{y})^7}$ .
- Write the following power expressions in terms of radicals (that is, square roots, cube roots etc):
  - $p^{1/6}q^{2/7}$ ;
  - $\frac{(x^{1/3}y^{1/4})^2}{x^{1/6}y^{3/5}}$ .

## ANSWERS.

- $\frac{a^9}{a^4} = \frac{aaaaaaaaa}{aaaa} = aaaaa = a^5 = a^{9-4}$ .
- $x^{-5}y^{-13}$ , or  $\frac{1}{x^5y^{13}}$ ;
  - $a^4b^{24/5}$ ;
  - $x^{1.7}y^{-2.3}$ , or  $\frac{x^{1.7}}{y^{2.3}}$ ;
  - $a^{-7}b^{-11}c^5$ , or  $\frac{c^5}{a^7b^{11}}$ .
- $a^{25/6}b^{1/6}$ ;
  - $x^{-9/4}y^{-5/6}$ .
- $\sqrt[6]{p} \sqrt[7]{q^2}$ ;
  - $\frac{\sqrt{x}}{\sqrt[10]{y}}$ .
